Cikarang Barat, Bekasi

Highly motivated Information Technology fresh graduate passionate about Software Engineering and Artificial Intelligence. Hands-on experience in developing Android applications, backend systems (Flask, Express.js), and deploying Machine Learning models. Ready to contribute technical expertise and a collaborative mindset to an innovative tech company

Educations

Universitas Esa Unggul Sep 2022 - Oct 2026

Bachelor of Computer Science, 3.86/4.00

- LDK IKMI Secretary: Managed administrative operations and spreadsheet databases for 50+ members across 15+ events, achieving an 80% average attendance rate.

Work Experience

PT Sumitomo Electric Wintec Indonesia Oct 2025 - Jan 2026

IT Intern

- Developed an Android-based application as a solo developer to digitize and streamline internal operational workflows, successfully transitioning manual procedures to a paperless system.
- Designed a Role-Based Access Control (RBAC) system with a dynamic dashboard accommodating 3 distinct permission levels (e.g., field operators, reviewers, and PIC).
- Implemented a hierarchical 4-stage tracking system with conditional access and dynamic input forms (supporting text, multiple-choice, and image uploads) to accelerate and monitor the reporting process.

Projects

Notacara

Thesis

- Built an AI-powered Android application to automate event expense tracking by extracting data from physical shopping receipts.
- Integrated a Python-based AI model for receipt scanning with a Kotlin-based frontend, achieving up to 92% data detection accuracy on standard receipts.
- Developed automated expense accumulation features (per event and overall) and implemented robust search and date filtering functionalities to enhance data management.

U.S. Tariff Sentiment Analysis

Research Methodology Course

- Conducted sentiment analysis on U.S. import tariff policies using over 10,000 cleaned data points crawled directly from Twitter.
- Developed, trained, and evaluated multiple classification models, specifically comparing SVM (using TF-IDF) and BiLSTM (using FastText).
- Achieved a peak classification accuracy of 91% with the BiLSTM model, significantly outperforming the SVM baseline (81%).

Secure Authentication Integration

Cyber Security Course

- Developed a Flask-based backend API to integrate a secure SHA-256 password hashing and strength validation system into an existing web application.
- Successfully refactored a standalone CLI-based hashing program into a scalable Flask API to handle user authentication seamlessly.
- Modified the existing HTML frontend (login and registration forms) to connect with the newly built Flask backend, ensuring secure data transmission before database storage.

Technical Skills

- **Programming Languages**: Python, Kotlin, JavaScript, PHP, HTML, CSS
- **Frameworks & Development**: Flask, Express.js, Android Development
- **Databases**: MySQL, SQL Server, Realm
- **ML & AI**: Scikit-Learn, TensorFlow, TensorFlow Lite (TFLite), FastText
- **Tools**: VS Code, Android Studio, Git, Google Colab, Figma, Spreadsheets
